                                                                                                   The present sequence represents a specific example of an anti-gastrin-17 inmunogen, comprising the N-terminal 9 amino acids of gastrin-17 conjugated to an immunogenic carrier such as Diphtheria toxoid, by a spacer peptide. This immunogenic composition is used in a new treatment of glycine-extended gastrin-17 (G17-G1y)-dependent gastrointestinal tumnours. Anti-G17 immunogenic composition is used in a new treatment tumnours. Anti-G17 immunogens raise antibodies which bind both the amidated and glycine-extended forms of G17. Neutralisation of progastrin G17-G1y prohormone by the antibodies inhibits the growth of tumour cells dependent on progastrin G17-G1y as growth stimulator or inducer. The method is especially for the treatment of colorectal adenocarcinomas in humans. The novel method is non-invasive, selectively reversible, does not damage normal tissue, does not require frequent repeated treatments and does not cross the blood brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunogenic; treatment; hypergastrinemia; gastrin G17; gastrin G34; /

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents an antigastrin-G17 immunogen. The invention relates to a method for treating tumours by immunologically neutralising a tumour growth factor and administering one or more chemotherapeutic agents. The method is useful for treating tumours, especially gastrin-dependent tumours, including colorectal, stomach, pancreatic and hepatocellular adenocarcinomas. The combination of anti-G17 immunisation and chemotherapeutic agents increases the therapeutic effects in controlling or inhibiting colorectal tumour growth
                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the treatment of gastroesophageal reflux disease (GERD) that comprises administering to a patient an immunogenic composition which generates anti-gastrin antibodies, which bind to gastrin, in a patient, and administering histamine H_2 antagonist or a proton pump inhibitor: The method provides a more effective method for controlling acid output by the stomach. The therapy is less costly. High gastrin levels associated with standard therapies are neutralized and undestrable side effects are reduced. The method permits a reduced dosage of acid reducing agent both at the acid production of dosages is acid production stimulating level (gastrin). Reduction of dosages is acid production stimulating level (gastrin). Reduction of dosages is acid production prologed treatment of GERD. In a combination therapy with H_2 agonists or proton pump inhibitors, anti-gastrin 17 antibody titers can be maintained by occasional bodster shots while gastric acid the esophagists to completely heal and no surgery is required. The present sequence represents a human heptadecagastrin (GI7) immunomimic

The present sequence represents a gastrin fragment analogue, where at least one of Tyrl2 and Phel7 is intended to be replaced by N benzylglycine. N-cyclohexylmethylglycine or the ring substituted derivatives thereof.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present sequence represents carboxy-amidated gastrin-17. Treatment of gastrin-17-dependent gastrointestinal tumours comprises administering to a mammal an anti-gastrin 17 (G17) immunogenic composition. Anti-G17 immunogens raise antibodies which bind both the amidated and glycine-extended forms of G17. Neutralisation of progastrin G17-G1y prohormone by the antibodies inhibits the growth of tumour cells dependent on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 progastrin G17-G1y as growth stimulator or inducer. The method is especially for the treatment of colorectal adenocarcinomas in humans. This novel method is non-invasive, selectively reversible, does not

The sequence represents a synthetic biotinylated peptide substrate for human Janus kinase 3 (JAK3). The invention relates to the use of JAK37TAT (Janus kinase/Asignal transducer and activator of transcription) inhibitors other than debromohymenialdisine (DBH) and hymenialdisine (H) for inhibiting the progression or the likelihood of developing diseases involving cartilage degradation, and for requiating the expression or the likelihood of the expression of pro-inflammatory agents or cytckines in a chondrocyte, and cartilage degrading enzymes in a cell. A JAK3/STAT inhibitor of the invention is useful for inhibiting progression or likelihood of developing osteoarthritis or rheumatoid arthritis. The inhibitor of the invention is useful for inhibiting progression or likelihood of the cuseful for treating other JAK/STAT-mediated disorders, and including T cell-mediated disorders include human T cell-mediated disorders include human T cell-mediated disorders include human T cell eleukaemia/lymphoma virus (HTLV)-1, Sdzory's syndrome, c-abl transformation, natural killer-like T cell lymphomas (NK-like tumours) and graft-vs-host disease; cytokine hypersensitivity disorders include and graft-vs-host disease; cytokine hypersensitivity disorders include and graft-vs-host disease; cytokine hypersensitivity disorders include acute lymphocytic and lymphoblastic leukaemias and lymphomas include acute lymphocytic and lymphoblastic leukaemias and lymphoglastic leukaemias of myeloid origin. DBH and He is the signification in which JAK3 plays a role in the infinitiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of inhibitors of Janus kinase/signal transducers and activators of transcription for inhibiting onset and progression of degenerative joint diseases or disorders such as osteoarthritis, rheumatoid

The present invention relates to detecting addition or removal of a phosphate group to or from a substrate. The method involves contacting a luminescent peptide with a binding partner that binds specifically of a phosphorylated peptide without regard to the particular amino acid sequence of the peptide. The method is useful for detecting phosphorylation and dephosphorylation modifications of proteins,
                                                                                                                                                                                                                                                                                                                                              Assay for detecting phosphorylation and dephosphorylation modification of proteins by contacting luminescence peptide with a binding partner and measuring change in luminescence polarization .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      including kinases and phosphatases. The methods can be used to study the kinase activity of different receptors e.g. the insulin receptor and to find agonists and antagonists of these receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and malelmido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3:50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half infa and specificity as bonding to large molecules decreases in the MB90823 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity

The invention relates to a reagent (I) for incorporation of a phosphorylation site by reaction with a reactive side chain of a compound to be phosphorylated. (I) comprises a structure A-B-C, where A is a moity that is specifically reactive with a reactive side chain, C is a petide sequence comprising kinase substrate, and B is a linking moiety selected from any one of the 19 compounds given in the specification e.g. N-gamma-maleimidobutyryloxy-succinamide ester. (I) is useful for phosphorylation, by reacting (I) with a compound to be phosphorylated compounds a protein or polypeptide) and then phosphorylating the resulting production or polypeptide) and then phosphorylating conditions comprising 32P-phosphorylating of synthesised proteins without the comprising 32P-phosphorylating already synthesised proteins, without the need to carry out recombinant methods to incorporate an amino acid sequence. The method is highly adaptable and can be used to phosphorylate or avoids production of proteins having an inaccessible kinase substrate sequence as can result from known recombinant methods. Introduction of sequence compliant method is possible merely by increasing the ratio of reagent to protein, and the method allows labeled increasing the ratio of reagent to protein site in protein's function or become phosphorylating does not interfere with the protein's function or pecome compliant in accessible as a result of protein folding. The method allows labeled compounds that have a higher specific activity that is cormally obtained with recombinant methods. The protein sequence cormally obtained with recombinant methods are useful in examples to protein folding. The present sequence cormally obtained with recombinant methods as the present sequence cormally obtained with recombinant methods. The present sequence cormally obtained with recombinant methods and the method in examples that demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

The present sequence represents glycine-extended gastrin-17. Treatment of glycine-extended gastrin-17 (Gl7-Gly)-dependent gastrointestinal tumours comprises administering an anti-gastrin 7 (anti-G17) immunogenic comprosition. Anti-G17 immunogens raise antibodies which bind both the amidated and glycine-extended forms of Gl7. Neutralisation of progastrin Gl7-Gly prohormone by the antibodies inhibits the growth of tumour cells dependent on progastrin Gl7-Gly as growth stimulator or adenocarcinomas in humans. This novel method is non-invasive, selectively reversible, does not damage normal tissue, does not require frequent repeated treatments and does not cross the blood brain
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Helper T cell epitope; universal immune stimulator; invasin; hapten;

Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytofoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid sequence from the invasin protein of Yersinia. Components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component.

The present sequence is an example of a gastrin hapten which can be bound to the immune stimulater furmant avaccine for treating to be peptic ulcer disease or gastrin-stimulated tumours.

Cipocias Court apparams hirous (domestic goat)

Cipocias Court apparams of Salatina purities from a single antum of dog and of goat.

Antities Sequence of Gastin is surjected from a single antum of dog and of goat.

Antities Sequence of Gastin is surjected from a single antum of dog and of goat.

Antuciant type: Protein

Antuciant type: Pytroidore carboxylic caid (gin) status experimental

Fill-Aproduct signification carboxylic caid (gin) status experimental

submitted to the EMBL Data Library, July 1999
A; Description: Pyrococcus abyssi genome sequence: insights into archaeal chromosome s
A; Reference number: A7501
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-335 < KAN>
A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         llarity 77.8%;

PTM: TWO DIFFERENT PROCESSING PATHWAYS PROBABLY EXIST IN ANTRAL G-CELLS. IN THE DOMINANT PATHWAY PROGASTRIN IS CLEAVED AT THREE SITES RESULTING IN TWO MAJOR BIOACTIVE GASTRINS, GASTRINS, GASTRIN GASTRIN-17. IN THE PUTATIVE ALTERNATIVE PATHWAY, PROGASTRIN MAY BE PROCESSED ONLY AT THE MOST C-TERMINAL DIBASIC SITE RESULTING IN THE SYNTHESIS OF GASTRIN-71.

SIMILARITY: BELONGS TO THE GASTRIN/CHOLECYSTOKININ FAMILY.

                                                                                                                                                                                                                                                                                                                                              FUNCTION: Gastrin stimulates the stomach mucosa to produce and secrete hydrochloric acid and the pancreas to secrete its digestive enzymes. It also stimulates smooth muscle contraction and increases blood circulation and water secretion in the stomach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Gastrin stimulates the stomach mucosa to produce and secrete hydrochloric acid and the pancreas to secrete its digestive enzymes. It also stimulates smooth muscle contraction and increases blood circulation and water secretion in the stomach and intestine.

Submitted (JUL-1999) to the NaD-DEPENDENT OXIDATIVE CLEAVAGE OF
FUNCTION: CATALYZES THE NAD-DEPENDENT OXIDATIVE CLEAVAGE OF
SPERMIDINE AND THE SUBSEQUENT TRANSFER OF THE BUTYLAMINE MOIETY OF
SPERMIDINE TO THE EPSILON-AMINO GROUP OF A SPECIFIC LYSINE RESIDUE
OF THE BIF-5A PRECURSOR PROTEIN TO FORM THE INTERMEDIATE
DEOXYHYPUSINE RESIDUE (BY SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Pyrococcus abyssi genome sequence: insights into archaeal chromosome
                                                                                                                                                                                                                                                                                                                                                         PYRROLIDONE CARBOXYLIC ACID (POTENTIAL). PYRROLIDONE CARBOXYLIC ACID (POTENTIAL).
